

# COMPOST TREET

## A Concentrated Source Of Natural Microorganisms Used for Composting

Compost Treet is a scientifically developed combination of selected microbials and nutrients designed to initiate and accelerate the composting process. Compost Treet assists natural decomposition of organic matter and produces more consistent, mature compost.

The bacteria in Compost Treet are a selected mixture of mesophiles and thermophiles. Mesophiles grow and metabolized well at medium temperatures (70°-115°F or 21°-46°C); thermophiles do well at higher temperatures (95°-140°F or 35°-60°C). These types of bacteria are the most effective decomposers in the composting process.

The viable microbes in Compost Treet also produce several enzymes. The highly active enzymes assist in the decomposition of plant cell walls and other organic material. Protease, amylase, xylanase and pectinase all work on hard-to-digest components of the compost material.

### **BENEFITS OF COMPOST TREET**

- More rapid heat production
- Controlled, optimum composting
- Convenient to use

### **GUARANTEED ANALYSIS:**

Not less than 2.2 Billion Colony Forming Units (C.F.U.s) of active bacteria per gram.

### **INGREDIENTS:**

Roughage products, calcium carbonate, calcium sulfate, ammonium phosphate and dried fermentation products.

### **DIRECTION FOR USE:**

50 lbs. (22.7 kg.) of Compost Treet will treat 10,000 cu. ft. (283 cu. meters) of compost material. Broadcast evenly over compost and mix thoroughly.

### **STORAGE AND HANDLING:**

Store in a cool, dry area for maximum stability. Avoid leaving container open for extended periods of time. This product is intended as a source of microorganisms only. Buyer assumes all responsibility for use, storage and handling of the product.
