Research Report

Title: Evaluation of Powdery Mildew Treatment Protocols

Location: Japan

Principal Investigators: Satoshi Yamanaka PhD, Section Manager at SDS BioTech K.K. Tsukuba

Technology Center, and Research and Development Biocontrol

Crop: Cucumber (Variety Hikari-3-gou-P)

Date: August 2, 2001

Abstract:

The purpose of this study was to assess the fungicidal potential of Armorex¹ and Fungastop² in comparison to Quinomethionate³ for treating powdery mildew (*Sphaerotheca fuliginea*) on cucumber plants. Each product was applied at four dilution rates. The plants were evaluated for disease severity after the treatment and a protective value was established for each of the protocols. Armorex had the highest average protective value of 90%, Quinomethionate had a average protective value of 53% and Fungastop at its highest concentration tested had a protective value of 25%.

Methods:

Cucumber plants were grown in greenhouse pots to 3.5 true leaf stage and inoculated with *S. fuliginea*. Each pot received 20 ml treatment of one of the following 12 protocols: Fungastop at 1%, .5%, .25%, .125% concentrations; Armorex at a concentration of 15%, 7.5%, 3.75%, 1.88%; Quinomethionate at 21 ppm, 10.5 ppm 5.3 ppm, and 2.7 ppm. Additionally, there was a control plot with no treatment. One day after treatment, all plants were inoculated with powdery mildew. Disease severity was observed in each of the protocols and documented as a percentage. Protective value was calculated based on relative disease severity compared to the control.

¹Armorex is a minimum risk pesticide manufactured by Soil Technologies Corp. in Fairfield, IA USA ²Fungastop is an EPA 25(b) list antifungal and antibacterial product manufactured by Soil Technologies Corp. in Fairfield, IA USA

Results:

Armorex had the highest average protective value of 90.8% compared to 52.7% for Quinomethionate and 6.25% for Fungastop. Table 1 shows the results of each treatment. However, at a concentration of 3.75% Armorex demonstrated a 93.33% protective value with no signs of phytotoxicity. Quinomethionate provided the second strongest average protective value while Fungastop provided a 25% protective value at its 1% concentration.

Material Concentration Disease Severity (%) Protective Value (%) Phytotoxicity				
Fungastop	1.00%	22.5	25	
	0.50%	30	0	
	0.25%	30	0	
	0.13%	32.5	0	
Armorex	15.00%	1.5	95	++
	7.50%	2	93.33	++
	3.75%	2	93.33	
	1.88%	5.5	81.67	
Quinomethiona te	21 (ppm)	6.25	79.17 -	
	10.5	6.75	77.5 -	
	5.3	13.75	54.17 -	
	2.7	30)
Control		30		

Table 1: Results of tests across all protocols

Conclusions:

Armorex had the highest protective value of 95% of all 12 treatments at a 15% concentration with plants demonstrating signs of phytotoxicity. At a concentration of 3.75% Armorex demonstrated a 93.33% protective value with no signs of phytotoxicity. Quinomethionate provided the fifth strongest protective value of 79.17% while Fungastop provided a 25% protective value at its highest concentration tested.
