## **Research Report**

**Title:** Evaluation of Armorex and Fungastop on the Treatment of Downy Mildew

**Location:** Japan

**Principal Investigators:** Satoshi Yamanaka PhD  
Section Manager  
SDS BioTech S.S Tsukuba Technology Center  
Biocontrol Research and Development

**Crop:** Cucumber (Variety Hikari-3-gou-P)

**Date:** August 2, 2001

### **Abstract:**

The purpose of this study was to assess the fungicidal potential of Armorex<sup>1</sup> and Fungastop<sup>2</sup> in treating downy mildew (*Pseudoperonospora cubensis*) on cucumber plants in comparison to Chlorothalonil<sup>3</sup>. Plants were treated with 12 protocols then inoculated with *P. cubensis*. The plants were then evaluated for disease severity and a protective value was established for each of the protocols. All three products had high efficacy against *P. cubensis*. Maximum protective values of the treatments were as follows: Chlorothalonil 100%, Armorex 97.0%, Fungastop 92.4%.

### **Methods:**

Cucumber plants were grown to the true leaf stage in a greenhouse setting. Each pot received 20 mL of one of the following 12 protocols: Fungastop at a concentration of 1%, .5%, .25%, .125%; Armorex at a concentration of 15%, 7.5%, 3.75%, 1.88%; Chlorothalonil at 16.7 ppm, 8.4 ppm, 4.2 ppm, 2.1 ppm. Additionally, there was a control plot with no treatment. One day after treatment, plants were inoculated with powdery mildew 10<sup>3</sup> spores/mL. Four days after inoculation the plants were evaluated for severity of disease on the first and second leaves.

<sup>1</sup>Armorex is a minimum risk pesticide manufactured by Soil Technologies Corp. in Fairfield, IA USA

<sup>2</sup>Fungastop is a natural alternative to synthetic agro-industrial chemicals with antifungal and antibacterial compounds manufactured by Soil Technologies Corp. in Fairfield, IA USA

<sup>3</sup>Chlorothalonil is a chemical pesticide regulated by the US EPA

**Results:**

Disease severity of *P. cubensis* on the control plant was evaluated at 82.5%. All treatment protocols demonstrated the ability to reduce the disease severity. Chlorothalonil had a 100% protective value at its three highest concentrations. Fungastop had a protective value of 92.4% at 1% concentration. Armorex had a protective value of 97.0% at its two highest concentrations, but both showed signs of phytotoxicity and a protective value of 89.4% at 3.75% concentration with no signs of phytotoxicity. Results are shown in Table 1.

Material	Concentration	Disease Severity (%)	Protective Value (%)	Phytotoxicity
Fungastop	1.00%	6.25	92.42%	--
	0.50%	12.5	84.85%	--
	0.25%	12.5	84.85%	--
	0.13%	17.5	78.79%	--
Armorex	15.00%	2.5	96.97%	++
	7.50%	2.5	96.97%	++
	3.75%	8.75	89.39%	--
	1.88%	18.75	77.27%	--
Chlorothalonil	16.5 (ppm)	0	100.00%	--
	8.4	0	100.00%	--
	4.2	0	100.00%	--
	2.1	2.5	96.97%	--
Control		82.5		--

Table 1: Results of test across all protocols

**Conclusions:**

All treatments demonstrated a high capacity for providing protection against downy mildew. Chlorothalonil provided 100% protection at several concentrations while Armorex provided a 96.97% protective value at 15% and 7.5% concentration but with signs of phytotoxicity. Fungastop also demonstrated efficacy with a maximum protective value of 92.42%.
