

CHASE

GRANULAR FORMULA

CHASE GRANULAR drives out burrowing animals from lawns, gardens, and ornamentals in a safe, economical manner. CHASE repels critters in spring, summer and fall.

HOW TO GET RID OF GOPHERS, MOLES, VOLES, AND ARMADILLOS

■ **WHY CHASE GRANULAR?** CHASE is a product based upon years of extensive independent research and field testing. These castor oil granules really work and **cover more area** and can be applied **in less time** than other products.

■ **HOW CHASE GRANULAR WORKS:** CHASE's special proprietary ingredients penetrate deep into the soil where burrowing animals live and feed. Since these critters don't like how the product tastes, smells, or feels, they become distressed and leave the area. CHASE **penetrates quickly** into the soil without leaving residues behind that could discolor grass or plants.

■ **CHASE GRANULAR MEETS ALL NEEDS...**

Easy Application: CHASE can be applied with **all spreaders** or by hand.

Effective: Castor oil pellets provide **maximum coverage** to deeply penetrate the soil and attack critters where they live to chase them away for up to 60 days.

Environmentally Friendly: CHASE is **biodegradable** and not harmful to humans, pets, birds, or plants.

Although there are a number of ways to control dreaded subterranean dwellers--from trapping and flooding to poison--master gardener Paul James (of HG-TV's **Gardening By The Yard** fame) prefers to repel them by using a granular form of his favorite repellent: castor oil. "This relatively new product does an excellent job of controlling moles and gophers as well as armadillos," according to James.

TECHNICAL DATA

HOW TO USE:

While you can apply CHASE evenly by hand, you may also use either a broadcast or drop spreader. The correct application rate, regardless of method, is one pound of CHASE per one thousand square feet. To initially set spreader, select a setting in the lower range of application rate. Then test setting by using one of these methods: The first is to put one-half pound of CHASE in spreader and apply to an area that is 500 square feet (approximately 7x7 normal walking paces). Readjust as necessary to reach the desired rate. To test setting with the second method, set the spreader and apply an ounce or two of CHASE over a small area of paved surface.

TREATING LARGE AREAS: While you can apply CHASE to your entire yard in one treatment, another strategy that has proved to be effective is to “move” the moles in the direction you’d like them to exit your property. To accomplish this, apply CHASE to one third of the area to be treated, beginning with the one furthest from the direction you want them to leave. If you want pests to move from your flower garden toward a fence, begin at the garden. Then (at one or two day intervals), apply the product to the other areas closer to the fence, ending with the one nearest to it. This approach is particularly effective when the area to be treated is larger than 100 feet by 100 feet.

WATERING IN: You can water CHASE in to speed its penetration into the soil, or you can let Mother Nature do it with the next rain. Over time the granules will decompose and release the repellent into the soil for a “time-released” treatment. In addition, the carrier used in the product is an all natural and fully biodegradable material that will benefit your lawn. Applying to wet soil works just fine too. The moisture begins the granule dissolving process and CHASE begins to leech into the soil almost immediately.

PRECAUTIONS AND FIRST AID: CAUTION. Since product can cause moderate eye irritation, the use of safety glasses is recommended. For certain individuals, prolonged skin contact may cause irritation. In case of eye contact, rinse with fresh water and seek medical attention. In case of skin irritation, wash with soap and water and call a physician if irritation persists.

STORAGE AND DISPOSAL: Store in original container in an area not accessible by children or pets. Do not reuse container. Discard in trash when empty.

NOTICE: If extreme heavy rainfall occurs right after application, it may be necessary to repeat application. Highly infected areas may require additional applications.

CHASE CASTOR OIL GRANULES...

- PROVIDE DEEPEST SOIL PENETRATION
- WORK WITH ALL SPREADERS
- MAX COVERAGE OF ALL MOLE, GOPHER REPELLENTS
- ARE ECONOMICAL FOR LARGE AREA USE
