## HERBICIDE CONCENTRATE

**Safe! And it smells good!**

Before  
spraying

1-hour after  
spraying

3-hours after  
spraying

**PHYDURA Works Faster Than Any  
Other Weed & Grass Killer**

### FOR AGRICULTURAL APPLICATIONS:

PHYDURA is a non-selective herbicide made from clove oil and other biodegradable ingredients. When you spray PHYDURA on annual weeds and grass, it binds to the surface of the weed and begins to destroy the cell structure through a burn down process. After PHYDURA is applied, the plant begins to stress, and results can be seen in as little as one hour after application.

EPA Registration Exempt: Per FIFRA Reg. 40CFR 152.25(f)  
PHYDURA is a trademark of Soil Technologies Corp., copyright 2016

## WEED AND GRASS KILLER

- PHYDURA kills weeds and grasses. Use in spot applications in most areas!
- Wilting begins in 30-60 minutes. Plants are dead or dying in 24 hours!
- PHYDURA knocks down annual weeds quickly. Perennial weeds may need multiple sprays to kill roots.
- Spray PHYDURA between planting rows and under fruit trees, berries, grapes, and ornamental crops.
- New planting can begin within hours after treating an area with PHYDURA!
- PHYDURA does not translocate to the roots of non-target plants.
- Workers can safely enter areas treated with PHYDURA right after spraying!

## Where To Use PHYDURA:

- Prepare and maintain planting beds and vegetable gardens.
- Keep centers clear in orchards and vineyards.
- Edge around trees, ornamentals and nursery crops.
- Keep fence lines clear of weeds and grasses.
- Spot treat around greenhouses and outbuildings, along driveways and sidewalks.

# PHYDURA™

## Application/Dilution/Dosage

**Young Smaller Weeds:** Mix with water at 3:1 ratio (3 parts water to 1 part Phydura). Apply diluted mixture as a fine mist. Spray diluted product directly on to target vegetation to completely cover all of the plant's leaves.

**Older Larger Weeds:** Mix with water at 2:1 ratio. Apply diluted mixture as a fine mist. Completely saturate the top and bottom of all target foliage.

**WARNING: Do not allow spray to contact desirable foliage.  
All contacted vegetation will be affected.**

For best results, spray in full sunlight during the warmest part of day. Phydura works best in non-shaded areas when temperatures are above 60°F. Spray Phydura directly on weeds until wet, but not to the point of run-off. Always spray Phydura when the plant is actively growing. Workers may re-enter treated areas after spray has dried. Fill tank 1/2 full with water. Start agitation, add Phydura and then fill tank with water. Some agitation during application is recommended. Repeat applications as needed.
